Release Notes 4.6.0

#define 4.6.0

- PrimePortal Integration
- SVN Hooks
- Auto Detecting Time Zone
- Synchronised Authorisation
- Extended Help Pages

#define 4.6.0

The latest release of #define 4 focuses on integration with PrimePortal to ensure that new PrimePortal accounts can use #define 4 instead of #define 3. The 4.6 release also includes user interface enhancements, the ability to configure svn hooks and numerous defect resolutions.

PrimePortal Integration

Clients who outsource work to Logica (now part of CGI) can keep track of project progress with PrimePortal¹, a “single-point-of-information” service and communication tool that provides a window to information stored in corresponding #define projects.

PrimePortal offers a dynamic and customisable interface which allows clients, stakeholders and partners to keep updated on their outsourced projects progress; emphasising our commitment to deliver a high quality service and solution.

The #define 4.6 releases will allow new PrimePortal customers to integrate with #define 4 instead of #define 3 – and is a significant step towards all #define 3 projects being migrated to #define 4.

SVN Hooks

Project managers can now configure pre-commit hooks in #define. This provides a powerful way to ensure any commit messages satisfy certain requirements (such as the need to include a ticket number) before a revision is made to the file archive.

Auto Detecting Time Zones

Rather than use GMT as a default time zone, #define now automatically identifies the time zone for individual users and uses this throughout #define. This should make #define more usable for users outside of GMT and reduce confusion between remote teams.

Synchronised Authorisation

There are no longer discrepancies between subversion and #define when accessing the version controlled project archive.

Extended Help Pages

We have added more content to the default #define help pages, detailing what information you can and cannot search for within a #define project. Importantly it highlights how in #define 4 you can now search milestones, attachments and mailing list messages. There are also instructions on how to create and update tickets via email.
